

Is there anything important to take into account on installation?

All components are checked to ensure they function correctly prior to delivery. To ensure they remain fully functional, please note the following points:

- Always comply with the circuit diagram. Incorrect connections can lead to defects on the CDI.
- Do not change the HT Unit and avoid an attachment with which the vibrations are transferred.
- Attach the fanwheel nut with the original star disc, otherwise you risk damaging the crankshaft or the fanwheel.
- The crankshaft bearings should be new, the spark plugs and spark plug connectors should be of good quality.
- In the case of high revs, secure the fan screws with LOCTITE.
- Modify the ring cable lug and plug on the ignition base plate.
